

My last chart, and this chart, I could spend the whole hour talking about this, and I may do that some evening, but this chart has an enormous amount of information on it. These are the discoveries. This is when we discovered it. The black curve is how much we used. For many years we found very much more than we used. But starting in 1980, we started finding less and less and less, and our use rate went up and up and up. Here is the 1970 blip, and it keeps on going up. For all of this time we were dipping into reserves. We have a lot of reserves left.

What will the future look like? One thing is certain, you cannot bump what you have not found. These graphs, the area under these curves represents the volume, the amount. So the area, if you put a smooth curve over this one, the area under that curve would represent the amount of oil that we have found.

The area under this consumption curve would represent the amount of oil that we use. You can't use oil you haven't found. Within some limits we can make the future look like we want it to look with enhanced recovery and feverish drilling and so forth. But I would submit that you can't pump what you haven't found, and I would like the listener to make his own judgment as to how much we can change what they predict here will be the future production of oil.
